Spring 2020	ATSC 5117U	Correlation of the number of hail reports and rising surface temperatures in the southeast	I will be collecting and comparing the number of hail reports made in the southeast with the 10 hottest years on record to see if there is a reduction in the number of reports made. Hail is typical of major storm systems which we have been getting a larger amount of recently, but we have also have had rising surface temperatures due to a changing of the climate. I will be comparing the reports to see if there is a reduction in the number of reports made for the southeast. I will start and focus primarily in Georgia and Alabama, if I have collected and done everything for those two states in time then I will then go outward to the rest of the states in the southeast which are: South Carolina, Florida, Mississippi, Tennessee, and North Carolina.
